When to apply my Dynamic Software Update?

- **Hot updates**: apply patches during runtime
  - Idea: “short restructuring” instead of “long restart”
  - Benefit: deploy updates quickly
  - Goal: minimize disruption
- **Topic**: optimize restructuring timing
  - Restructuring atomic, ms-mins in practice
  - Goal: given the duration, what are suitable moments in near future to apply an update?
  - Approach: infer short-term communication and workload of a system from distributed communication and workload
